HAIL ALERTING

Using the live Hail detection radar network, EWN Operations staff work 24/7, 365 days per year monitoring these systems and sending out alerts to staff and/or customers whenever a large hail event (2cm +) is detected.

Upon a storm being detected on the radar network with hail 2cm or larger, EWN staff will send an alert for the area in the path of the storm advising of the storm's location and hail size plus areas likely to be impacted over the following 30 to 60 minutes. Alerts are sent via both email and SMS. Landline calls and an API are also available.

EWN also provides the Hail Alerts as a branded option for organizations looking at sending them out to their customers or staff.
